

WhatsApp OMS

Order Management System — Administrator Guide

Website	<code>https://oms.ysps.shop</code>
Username	<code>admin</code>
Password	Set by you at first sign-in. To reset, see Resetting a password on page 4.
Prepared	04 August 2026

What this system does

It reads your WhatsApp order groups, turns customer messages into matched product lines with SKUs, and lets your team reply — all from one web page, with a record of who did what.

Keep this document internal

Anyone with the link and a login can read every customer conversation and send messages as your business. Do not share it outside the company.

1. Getting started

The system runs on your own server and is reachable from anywhere at **<https://oms.ysps.shop>**. Nothing needs installing — any modern browser works, on desktop or phone.

Signing in

1. Open **<https://oms.ysps.shop>**.
2. Enter your username and password.
3. First-time users are asked to choose their own password before continuing.
4. On a browser you have never used before, a **6-digit code** is emailed to you — enter it once and that browser is remembered.

Every user gets their own login

Do not share one account. Replies are stamped with the username of whoever sent them, so individual logins are what make that record meaningful.

Two-step verification

The emailed code protects the account when someone's password leaks: a stranger with the password still cannot get in without the code. It only works for users whose **email address** is filled in on the Users page — accounts without one show a **no 2FA** badge there and skip the check, so fill every email in. If a phone or laptop is lost, open **Users** and press **Reset 2FA** on that person: every browser they used will ask for a fresh code.

The screen at a glance

Area	What it is for
Left — chat list	Every WhatsApp chat. Unread chats rise to the top with a green count.
Middle — conversation	The messages, exactly as in WhatsApp. Type here to reply.
Right — order panel	Products found in the message you selected, ready to copy.
Top right — status	Green Live chat means WhatsApp is connected.

2. Processing an order

The core routine your team will repeat all day.

1. Click a chat on the left. Chats with new messages appear at the top with a green badge.
2. Find the customer's order message and click it. The system reads the products out of it.
3. The right panel fills with the order lines, in the same order the customer wrote them. A **green** line was recognised. An **orange** line needs your help.
4. For each orange line, click it and search for the correct product. Your choice is remembered — next time that wording matches automatically.
5. Adjust quantities in the small box on the left of each row if needed.
6. Click **Copy**. The order is copied to your clipboard as quantity and SKU, ready to paste into your ordering system.

Matched rows are filled light green

A matched line has a light-green background; a line that still needs you stays white with an orange edge — visible even to colorblind users. Nothing is cut off: long product names and long customer wording wrap onto extra lines.

Adding an item the customer did not write

Click **+ Add item** under the order lines to put an extra product on the order — for example the customer wants a 1/2" pump you only stock in 3/4", so you send the 3/4" pump plus the reducer that makes it fit. Search, pick, done. Added items go into the Final Order like any other line.

The DDI order number

After you press **Copy** and enter the order into DDI, a **DDI order #** box appears under the Final Order. Type the number DDI gave you and press Save — the message then shows "Processed by you · DDI #12345" for everyone.

One order spread over several messages

Customers often send an order in pieces — "send me this", then "and also this". You do not have to do them one at a time. Click **Extract** on each message in turn and their products stack up into a single order in the right panel. The header tells you how many messages you have pulled in. Clicking an extracted message again removes just that message's lines, and **Copy** finishes the whole order and marks every one of those messages processed.

The system learns from your corrections

Every unmatched item you resolve is saved permanently. Matching starts basic and gets noticeably better over the first few weeks of real use.

What the labels mean

Label	Meaning
Extract	The button on a message that pulls its products out. Clicking the message text just selects it, like any page.
Extracted	This message's products are in the panel on the right.

Label	Meaning
Processed	The order was copied. Shows who completed it.
Re-Extract	Already processed — click to load it again.

Buttons in the order panel

Button	What it does
Copy	Copies the order and marks the message processed. If copying fails it says so and marks nothing.
Clear	Empties the panel. Does not undo anything already copied.

3. Replying to customers

Type in the box at the bottom of the conversation and press **Enter**. Use **Shift + Enter** for a new line within the same message.

Tagging someone

Type @ and a list of people in that chat appears. Keep typing to narrow it, then press Enter or click a name. The person is properly tagged in WhatsApp and receives a notification.

Attachments, voice notes and emojis

The **paperclip** sends a photo or file (up to 16 MB). The **microphone** records a voice note — a recording bar shows the time with Cancel and Send, and it arrives in WhatsApp as a real voice message, not a file. The **smiley** button opens an emoji picker with search (“fire”, “thanks”, “truck”...) where your most-used emojis rise to the top automatically.

The message menu

Hover over any message and click the small  arrow in its corner (on a phone the arrow is always visible — or press and hold). Right-click works too. The menu has the same actions WhatsApp gives you:

Action	What it does
Reply	Quotes that message above your reply, like WhatsApp.
Copy	Copies the message text to your clipboard.
Forward	Sends a copy to another chat you pick. It goes out signed with YOUR username, like any message you send.
Star	Stars the message in the linked WhatsApp account (it appears under Starred on the phone) and shows a small ★ on it here.
Pin	Pins the message in the chat for 7 days, like WhatsApp — everyone in the chat sees the pin. A bar above the conversation shows the pinned message; click it to jump there.
Download	On photos, voice notes and files: saves the file to your computer under its original name.
Delete	Only appears on messages you sent from this system. Delete for everyone removes it from the WhatsApp chat for all members (WhatsApp only allows this for a while after sending). Delete for me hides it in this system only.

The emoji row on top of the menu **reacts** to the message, exactly like tapping it in WhatsApp — the customer sees your reaction. The **X** takes your reaction back. To put emojis inside a message you are typing, click the smiley button next to the paperclip.

Nobody can delete a message someone else sent — not even an administrator.

How replies are marked

Every message sent from this system carries a signature so anyone reading WhatsApp can see it came from the OMS and who wrote it:

Delivery is on the truck, arriving 7am

BY **ADMIN**

In WhatsApp that last line begins with a small writing-hand emoji, followed by **BY** and the username in bold.

Inside the OMS that line is hidden and shown instead as a green **Sent by <username>** tag, so the conversation stays clean. Messages typed directly in WhatsApp on a phone have no signature and no tag — which is exactly how you tell the two apart.

Send carefully — these are real customers

There is no undo. Messages go to live customer groups the moment you press Enter. Send one message at a time and never use this for bulk messaging.

4. Administrator tasks

Only administrators see the **Users** and **Settings** links in the header.

Adding a user

1. Click **Users** in the top-right, then **+ Add user**.
2. Enter a username — letters and numbers only, no spaces or symbols.
3. Enter their full name, **email address**, choose **User** or **Admin**, and set a temporary password.
4. If an email is filled in, the person automatically receives a welcome email with the website address, their username and the temporary password. They must change it when they first sign in.

The Settings page

Everything the system does on its own is configured here.

Setting	What it does
Email sending	Which account sends the sign-in codes, welcome emails and alerts. Choose SMTP (Gmail or any mail server) or Microsoft 365 (Graph API — needs an Azure app registration with the Mail.Send permission: Tenant ID, Client ID, Client Secret and the sending mailbox).
Send a test email	Sends a test message to your own email address, so you know the configuration works before anyone needs a code.
New-device alerts	When switched on, every administrator with an email address gets a message whenever someone signs in from a device they have not used before.

The Activity page

An audit trail of who did what: sign-ins (including **failed** attempts and new devices), messages sent, deletes, forwards, reactions, order saves, DDI numbers, taught words, user and settings changes. Filter by user, by action and by date range. Kept for 90 days. Reading chats is not logged — only actions are.

The Report page

Administrators only, like every page beyond Order Matching. Search any SKU or description and see every match record grouped by product — saved order lines (with date, who saved it and the DDI number) and **learned** wordings taught by hand, each marked with a chip and deletable if wrong. Date-range filter, tick-boxes and a CSV export of exactly the ticked products.

Why usernames have no spaces

The username appears in the signature on every message sent. A space would make that line impossible to read back reliably, so the rule is enforced.

Removing or suspending someone

Use **Edit** to set a user to **Disabled** — they are signed out everywhere immediately, and their past activity is preserved. Use **Delete** to remove the account entirely. You cannot delete or disable yourself, and the last administrator cannot be removed.

Resetting a password

Use **Edit** on the user and set a new password; they will be asked to change it at next sign-in. If nobody can sign in at all, run this on the server:

```
cd C:\Whatsapp_OMS\services\whatsapp-ingestion
npm run set-password -- admin YourNewPassword
```

Roles: **Admin** can manage users and re-link WhatsApp. **User** can read chats, process orders and reply — nothing else.

The product catalogue

Product data refreshes itself from the DDI export email. Nobody needs to upload anything — the system checks the mailbox twice a day, shortly after each export arrives, and loads the new catalogue without interrupting anyone using the site.

Runs at	23:30 and 11:30 every day
Reads from	ysddiexport@gmail.com — emails with ZTMPEXP in the subject
Report sent to	ruturajysps@gmail.com after every run
Run it manually	<code>npm run import:products</code>

Watch the report email

A report arrives after every run, whether it succeeded or failed. If one says failed — or they stop arriving altogether — the catalogue has stopped updating and prices or stock may be going stale.

Two safeguards are built in. The mailbox is opened **read-only**, so nothing is marked as read, moved or deleted and the existing customer-portal import is unaffected. And an export with fewer than 1,000 rows is **rejected** rather than loaded, so a truncated file cannot wipe the catalogue. Every download is kept in the `imports` folder as a record.

5. If something goes wrong

The status pill in the top right tells you the state of the WhatsApp connection.

You see	What it means	What to do
Green Live chat	Everything is working.	Nothing.
Blurred screen , "Connecting..."	Starting up or briefly reconnecting.	Wait about a minute. It clears itself.
Blurred screen , "needs to be re-linked"	WhatsApp signed the device out.	An admin must re-link — see below.
Cannot reach the server	Your internet or the server is down.	Check your connection, then reload.

Re-linking WhatsApp (administrators only)

1. On the server, open `http://localhost:3009/qr`.
2. On the business phone: WhatsApp → **Linked devices** → **Link a device**.
3. Scan the code. The blurred screen clears within a few seconds.

The QR page is deliberately blocked from the public address

Scanning that code links a phone to your business WhatsApp with full access. It can only be opened on the server itself, and only by an administrator.

Good to know

- **Nothing is lost while disconnected.** WhatsApp holds messages and the system collects them when it reconnects.
- **It restarts itself.** Both the app and the secure tunnel start automatically after a server reboot, and the connection repairs itself if it ever hangs.
- **Order history is yours.** Messages, matches and learned products are stored in a database on your own server, not in WhatsApp.

6. Reference

Pages

Address	Who can open it
<code>oms.ysps.shop</code>	Order matching — everyone
<code>oms.ysps.shop/report</code>	Match report + learned product names — administrators
<code>oms.ysps.shop/admin</code>	User management — administrators
<code>localhost:3009/qr</code>	Re-link WhatsApp — administrators, on the server

Keyboard shortcuts

Key	Action
Enter	Send the message
Shift + Enter	New line in the same message
@	Tag someone in the chat
↑ ↓ then Enter	Pick a name from the tag list
Esc	Close the tag list

On the server

Purpose	Command
Check it is running	<code>sc query whatsappOMS</code>
Restart the system	<code>Restart-Service whatsappOMS</code>
Reset a password	<code>npm run set-password -- admin NewPass123</code>
View recent activity	<code>Get-Content logs\service.out.log -Tail 40</code>

One limitation worth knowing

This system connects through WhatsApp Web, the same way a linked laptop does. Meta's official business API cannot be used here because it cannot send into group chats that customers created — and group chats are where your orders arrive. Keep replies human-paced and never automate sending.
